

# Layout Decisions

9

**PowerPoint presentation to accompany  
Heizer and Render  
Operations Management, Global Edition, Eleventh Edition  
Principles of Operations Management, Global Edition, Ninth Edition**

**PowerPoint slides by Jeff Heyl**

# Outline

- ▶ **Global Company Profile:**  
McDonald's
- ▶ The Strategic Importance of Layout Decisions
- ▶ Types of Layout
- ▶ Office Layout
- ▶ Retail Layout
- ▶ Warehousing and Storage Layouts

# Outline - Continued

- ▶ Fixed-Position Layout
- ▶ Process-Oriented Layout
- ▶ Work Cells
- ▶ Repetitive and Product-Oriented Layout

# Learning Objectives

**When you complete this chapter you should be able to:**

- 1. Discuss** important issues in office layout
- 2. Define** the objectives of retail layout
- 3. Discuss** modern warehouse management and terms such as ASRS, cross-docking, and random stocking
- 4. Identify** when fixed-position layouts are appropriate

# Learning Objectives

**When you complete this chapter you should be able to:**

- 5. Explain** how to achieve a good process-oriented facility layout
- 6. Define** work cell and the requirements of a work cell
- 7. Define** product-oriented layout
- 8. Explain** how to balance production flow in a repetitive or product-oriented facility

# Innovations at McDonald's

- ▶ Indoor seating (1950s)
- ▶ Drive-through window (1970s)
- ▶ Adding breakfast to the menu (1980s)
- ▶ Adding play areas (late 1980s)
- ▶ Redesign of the kitchens (1990s)
- ▶ Self-service kiosk (2004)
- ▶ Now three separate dining sections

# Innovations at McDonald's

- ▶ Indoor seating (1950s)
- ▶ Drive-through window
- ▶ Adding breakfast to menu
- ▶ Adding play areas
- ▶ Redesign of the kitchen
- ▶ Self-service kiosk (2004)
- ▶ Now three separate dining sections

**Six out of the seven are layout decisions!**

# McDonald's New Layout

- ▶ Seventh major innovation
- ▶ Redesigning all 30,000 outlets around the world
- ▶ Three separate dining areas
  - ▶ Linger zone with comfortable chairs and Wi-Fi connections
  - ▶ Grab and go zone with tall counters
  - ▶ Flexible zone for kids and families
- ▶ Facility layout is a source of competitive advantage

# **Strategic Importance of Layout Decisions**

**The objective of layout strategy is to develop an effective and efficient layout that will meet the firm's competitive requirements**

# Layout Design Considerations

- ▶ Higher utilization of space, equipment, and people
- ▶ Improved flow of information, materials, or people
- ▶ Improved employee morale and safer working conditions
- ▶ Improved customer/client interaction
- ▶ Flexibility

# Types of Layout

1. Office layout
2. Retail layout
3. Warehouse layout
4. Fixed-position layout
5. Process-oriented layout
6. Work-cell layout
7. Product-oriented layout

# Types of Layout

1. *Office layout*: Positions workers, their equipment, and spaces/offices to provide for movement of information
2. *Retail layout*: Allocates shelf space and responds to customer behavior
3. *Warehouse layout*: Addresses trade-offs between space and material handling

# Types of Layout

- 4. *Fixed-position layout*: Addresses the layout requirements of large, bulky projects such as ships and buildings
- 5. *Process-oriented layout*: Deals with low-volume, high-variety production (also called job shop or intermittent production)

# Types of Layout

- 6. *Work cell layout*: Arranges machinery and equipment to focus on production of a single product or group of related products
- 7. *Product-oriented layout*: Seeks the best personnel and machine utilizations in repetitive or continuous production

# Layout Strategies

**TABLE 9.1** Layout Strategies

	OBJECTIVES	EXAMPLES
<b>Office</b>	Locate workers requiring frequent contact close to one another	Allstate Insurance Microsoft Corp.
<b>Retail</b>	Expose customer to high-margin items	Kroger's Supermarket Walgreen's Bloomingdale's
<b>Warehouse (storage)</b>	Balance low-cost storage with low-cost material handling	Federal-Mogul's warehouse The Gap's distribution center
<b>Project (fixed position)</b>	Move material to the limited storage areas around the site	Ingall Ship Building Corp. Trump Plaza Pittsburgh Airport

# Layout Strategies

**TABLE 9.1** Layout Strategies

	OBJECTIVES	EXAMPLES
<b>Job Shop (process oriented)</b>	Manage varied material flow for each product	Arnold Palmer Hospital Hard Rock Cafe Olive Garden
<b>Work Cell (product families)</b>	Identify a product family, build teams, cross train team members	Hallmark Cards Wheeled Coach Ambulances
<b>Repetitive/ Continuous (product oriented)</b>	Equalize the task time at each workstation	Sony's TV assembly line Toyota Scion

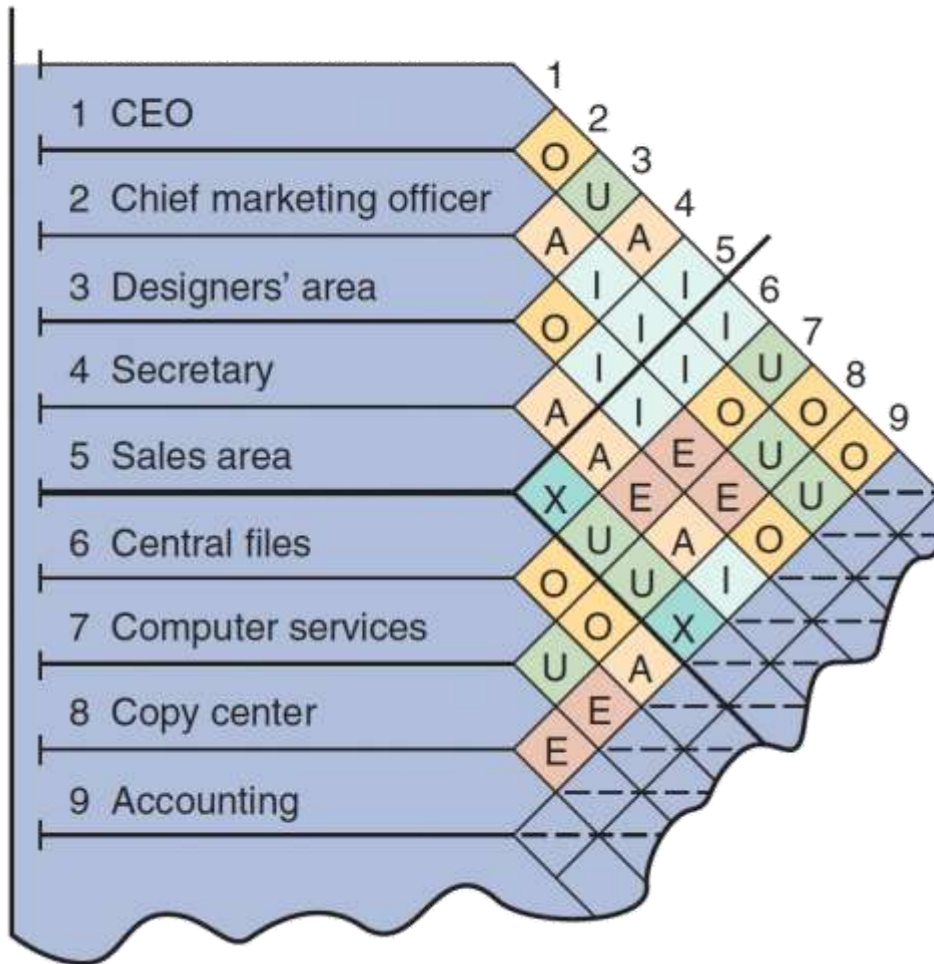

# Good Layouts Consider

- ▶ Material handling equipment
- ▶ Capacity and space requirements
- ▶ Environment and aesthetics
- ▶ Flows of information
- ▶ Cost of moving between various work areas

# Office Layout

- ▶ Grouping of workers, their equipment, and spaces to provide comfort, safety, and movement of information
- ▶ Movement of information is main distinction
- ▶ Typically in state of flux due to frequent technological changes

# Relationship Chart

Value	CLOSENESS
A	Absolutely necessary
E	Especially important
I	Important
O	Ordinary OK
U	Unimportant
X	Not desirable

Figure 9.1

# Office Layout

- ▶ Three physical and social aspects
  - ▶ Proximity
  - ▶ Privacy
  - ▶ Permission
- ▶ Two major trends
  - ▶ Information technology
  - ▶ Dynamic needs for space and services

# Supermarket Retail Layout

- ▶ Objective is to maximize profitability per square foot of floor space
- ▶ Sales and profitability vary directly with customer exposure

# Five Helpful Ideas for Supermarket Layout

1. Locate high-draw items around the periphery of the store
2. Use prominent locations for high-impulse and high-margin items
3. Distribute power items to both sides of an aisle and disperse them to increase viewing of other items
4. Use end-aisle locations
5. Convey mission of store through careful positioning of lead-off department

# Store Layout

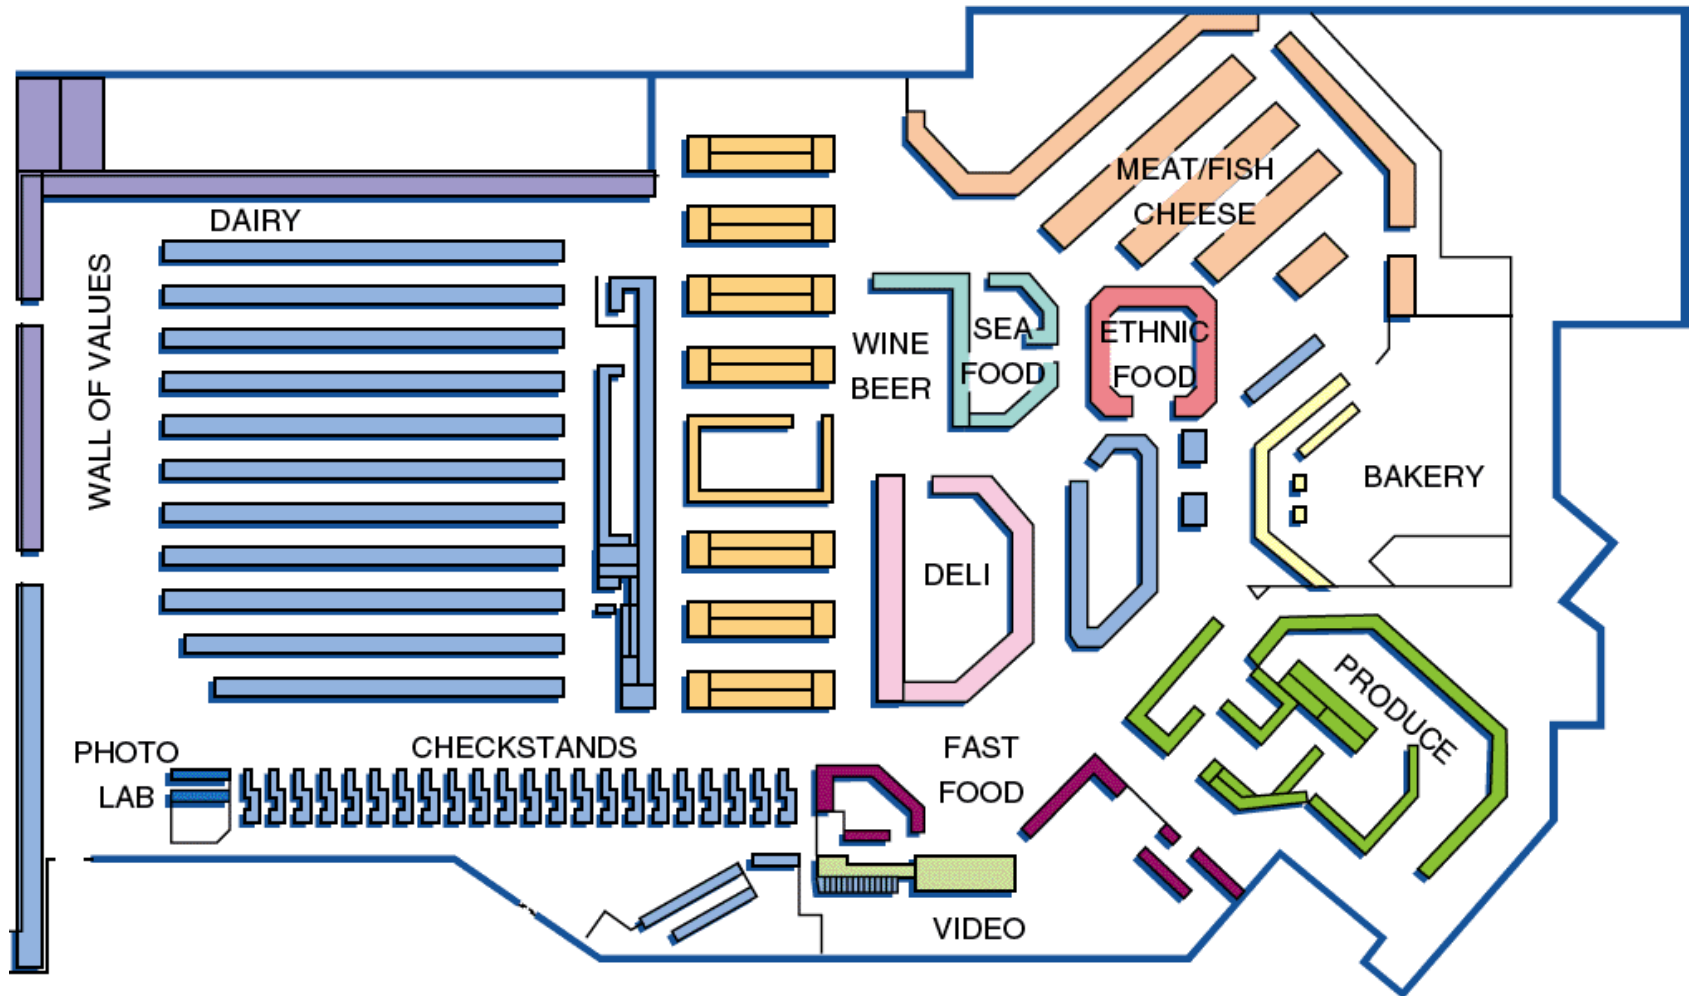

Figure 9.2

# Retail Slotting

- ▶ Manufacturers pay fees to retailers to get the retailers to display (slot) their product
- ▶ Contributing factors
  - ▶ Limited shelf space
  - ▶ An increasing number of new products
  - ▶ Better information about sales through POS data collection
  - ▶ Closer control of inventory

# Servicescapes

1. *Ambient conditions* - background characteristics such as lighting, sound, smell, and temperature
2. *Spatial layout and functionality* - which involve customer circulation path planning, aisle characteristics, and product grouping
3. *Signs, symbols, and artifacts* - characteristics of building design that carry social significance

# Warehousing and Storage Layouts

- ▶ Objective is to optimize trade-offs between handling costs and costs associated with warehouse space
- ▶ Maximize the total “cube” of the warehouse – utilize its full volume while maintaining low material handling costs

# Warehousing and Storage Layouts

## Material Handling Costs

- ▶ All costs associated with the transaction
  - ▶ Incoming transport
  - ▶ Storage
  - ▶ Finding and moving material
  - ▶ Outgoing transport
  - ▶ Equipment, people, material, supervision, insurance, depreciation
- ▶ Minimize damage and spoilage

# Warehousing and Storage Layouts

- ▶ Warehouse density tends to vary inversely with the number of different items stored
- ▶ Automated Storage and Retrieval Systems (ASRSs) can significantly improve warehouse productivity by an estimated 500%
- ▶ Dock location is a key design element

# Cross-Docking

- ▶ Materials are moved directly from receiving to shipping and are not placed in storage in the warehouse
- ▶ Requires tight scheduling and accurate shipments, bar code or RFID identification used for advanced shipment notification as materials are unloaded

# Random Stocking

- ▶ Typically requires automatic identification systems (AISs) and effective information systems
- ▶ Allows more efficient use of space
- ▶ Key tasks
  1. Maintain list of open locations
  2. Maintain accurate records
  3. Sequence items to minimize travel, pick time
  4. Combine picking orders
  5. Assign classes of items to particular areas

# Customizing

- ▶ Value-added activities performed at the warehouse
- ▶ Enable low cost and rapid response strategies
  - ▶ Assembly of components
  - ▶ Loading software
  - ▶ Repairs
  - ▶ Customized labeling and packaging

# Fixed-Position Layout

- ▶ Product remains in one place
- ▶ Workers and equipment come to site
- ▶ Complicating factors
  - ▶ Limited space at site
  - ▶ Different materials required at different stages of the project
  - ▶ Volume of materials needed is dynamic

# Alternative Strategy

- ▶ As much of the project as possible is completed off-site in a product-oriented facility
- ▶ This can significantly improve efficiency but is only possible when multiple similar units need to be created

# Process-Oriented Layout

- ▶ Like machines and equipment are grouped together
- ▶ Flexible and capable of handling a wide variety of products or services
- ▶ Scheduling can be difficult and setup, material handling, and labor costs can be high

# Process-Oriented Layout

Figure 9.3

# Process-Oriented Layout

- ▶ Arrange work centers so as to minimize the costs of material handling
- ▶ Basic cost elements are
  - ▶ Number of loads (or people) moving between centers
  - ▶ Distance loads (or people) move between centers

# Process-Oriented Layout

$$\text{Minimize cost} = \sum_{i=1}^n \sum_{j=1}^n X_{ij} C_{ij}$$

where

- $n$  = total number of work centers or departments
- $i, j$  = individual departments
- $X_{ij}$  = number of loads moved from department  $i$  to department  $j$
- $C_{ij}$  = cost to move a load between department  $i$  and department  $j$

# Process Layout Example

Arrange six departments in a factory to minimize the material handling costs. Each department is 20 x 20 feet and the building is 60 feet long and 40 feet wide.

1. Construct a “from-to matrix”
2. Determine the space requirements
3. Develop an initial schematic diagram
4. Determine the cost of this layout
5. Try to improve the layout
6. Prepare a detailed plan

# Process Layout Example

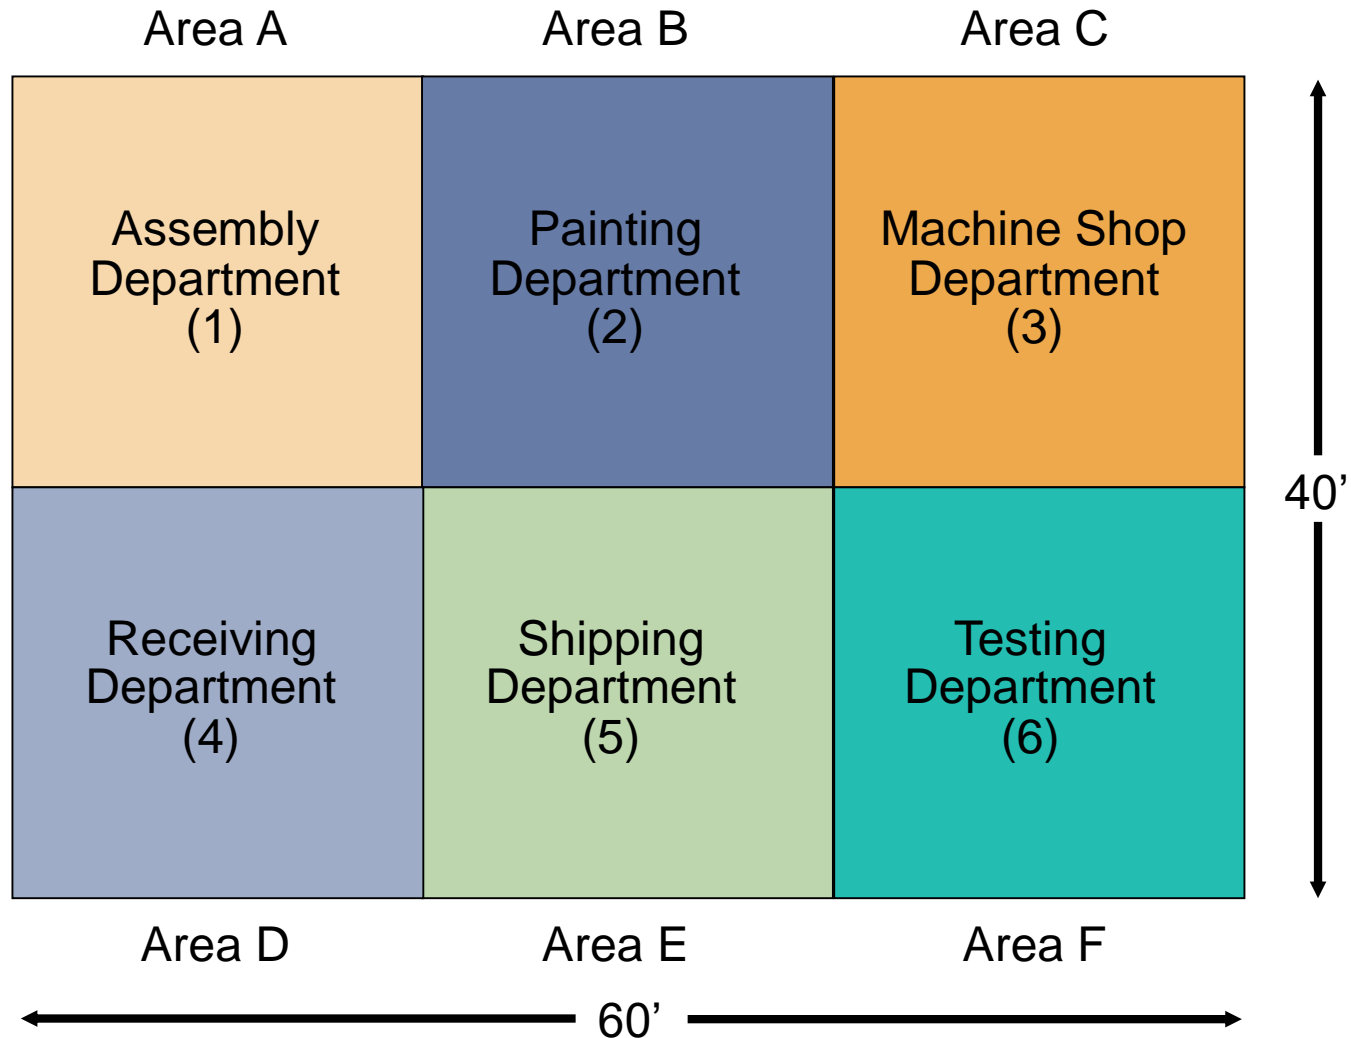

Figure 9.4

Number of loads per week

Department	Assembly (1)	Painting (2)	Machine Shop (3)	Receiving (4)	Shipping (5)	Testing (6)
Assembly (1)		50	100	0	0	20
Painting (2)			30	50	10	0
Machine Shop (3)				20	0	100
Receiving (4)					50	0
Shipping (5)						0
Testing (6)						

# Process Layout Example

Figure 9.5

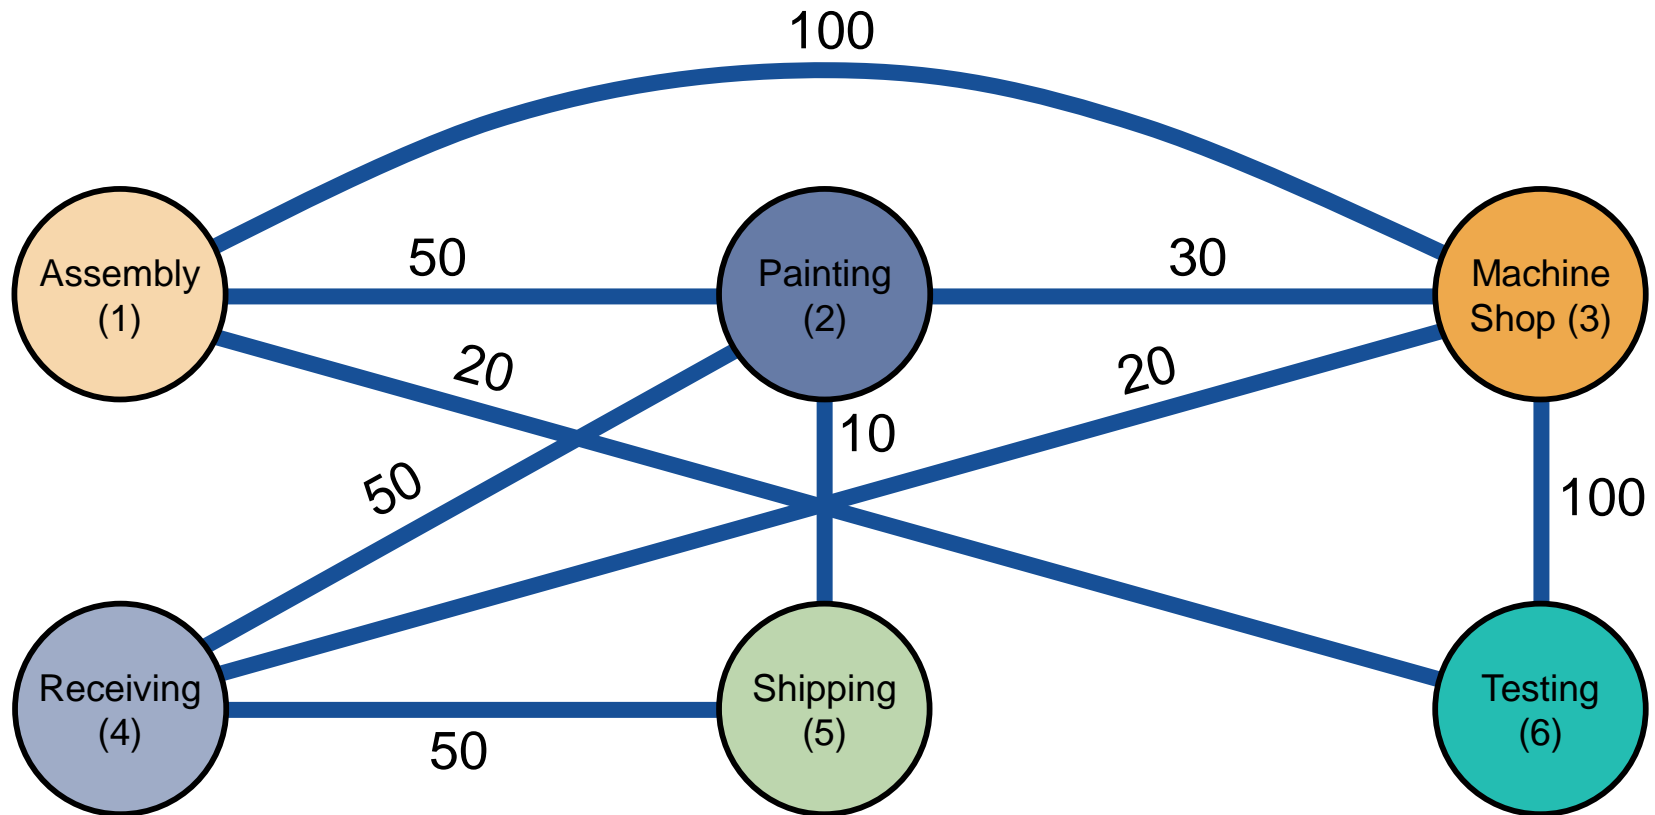

# Process Layout Example

Interdepartmental Flow Graph

Figure 9.6

# Process Layout Example

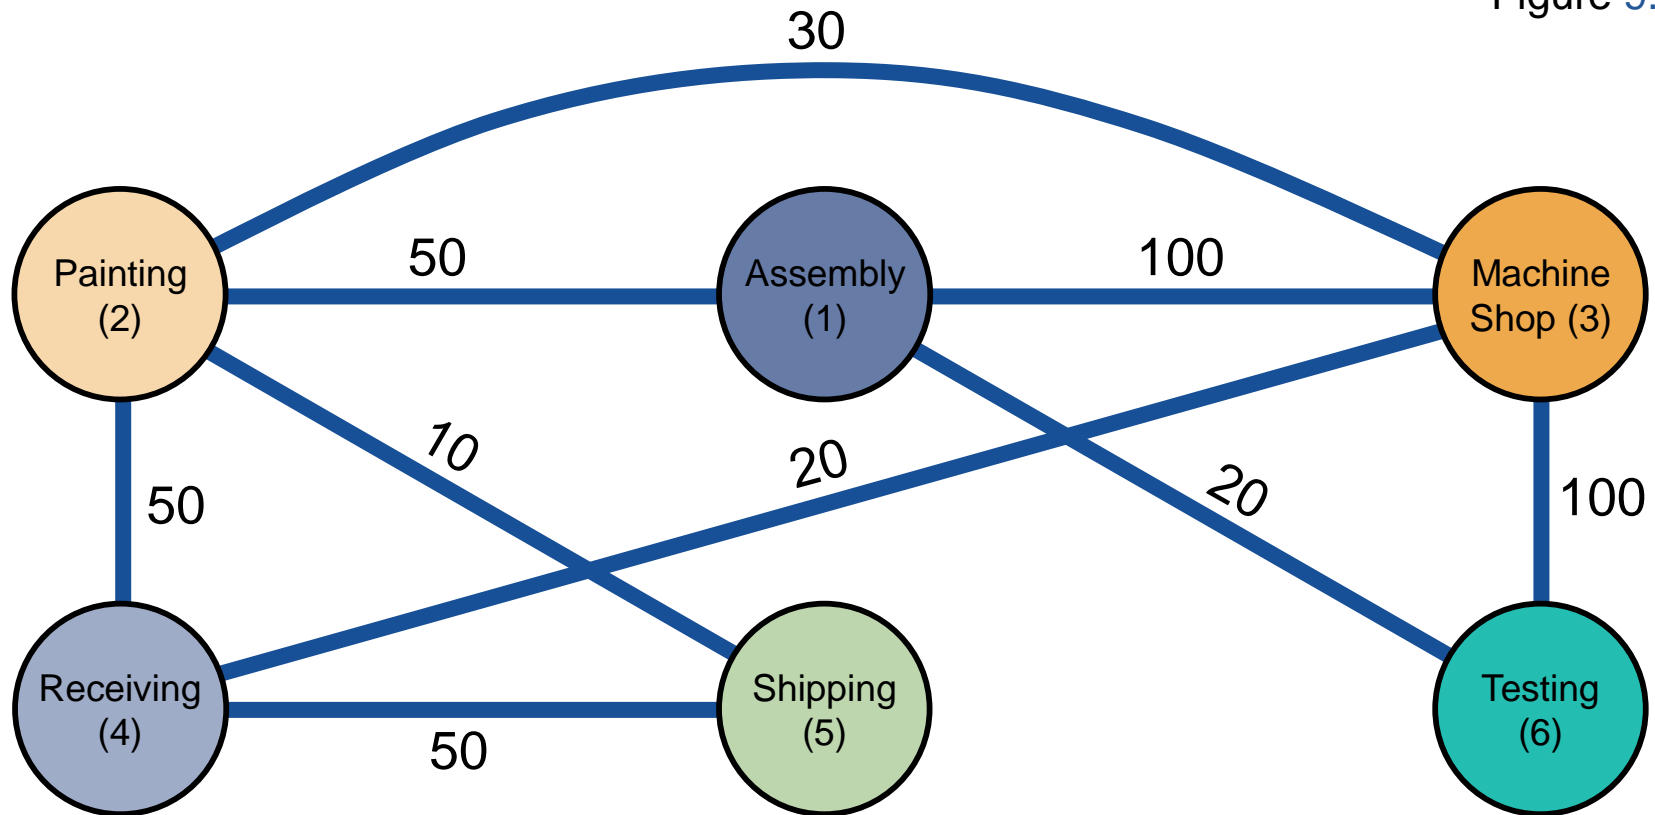

$$\text{Cost} = \sum_{i=1}^n \sum_{j=1}^n X_{ij} C_{ij}$$

$$\begin{aligned} \text{Cost} &= \begin{array}{ccc} \$50 & + & \$200 & + & \$40 \\ (1 \text{ and } 2) & (1 \text{ and } 3) & (1 \text{ and } 6) \end{array} \\ &+ \begin{array}{ccc} \$30 & + & \$50 & + & \$10 \\ (2 \text{ and } 3) & (2 \text{ and } 4) & (2 \text{ and } 5) \end{array} \\ &+ \begin{array}{ccc} \$40 & + & \$100 & + & \$50 \\ (3 \text{ and } 4) & (3 \text{ and } 6) & (4 \text{ and } 5) \end{array} \\ &= \$570 \end{aligned}$$

# Process Layout Example

## Revised Interdepartmental Flow Graph

Figure 9.7

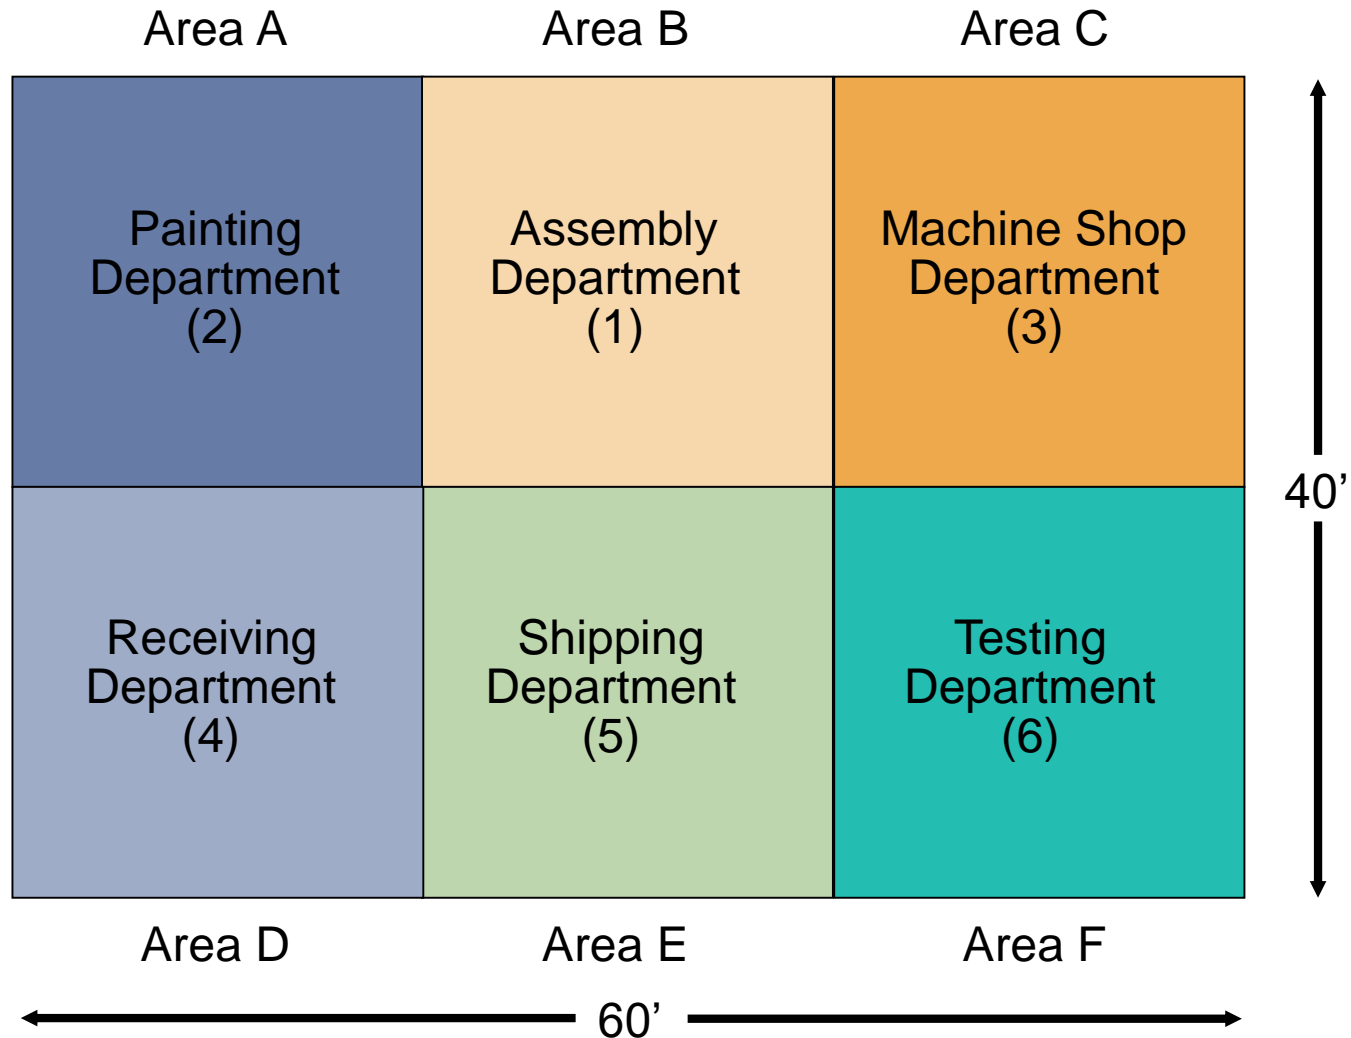

# Process Layout Example

$$\text{Cost} = \sum_{i=1}^n \sum_{j=1}^n X_{ij} C_{ij}$$

$$\begin{aligned} \text{Cost} &= \begin{array}{ccc} \$50 & + & \$100 & + & \$20 \\ (1 \text{ and } 2) & (1 \text{ and } 3) & (1 \text{ and } 6) \end{array} \\ &+ \begin{array}{ccc} \$60 & + & \$50 & + & \$10 \\ (2 \text{ and } 3) & (2 \text{ and } 4) & (2 \text{ and } 5) \end{array} \\ &+ \begin{array}{ccc} \$40 & + & \$100 & + & \$50 \\ (3 \text{ and } 4) & (3 \text{ and } 6) & (4 \text{ and } 5) \end{array} \\ &= \$480 \end{aligned}$$

# Process Layout Example

Figure 9.8

# Computer Software

- ▶ Graphical approach only works for small problems
- ▶ Computer programs are available to solve bigger problems
  - ▶ CRAFT
  - ▶ ALDEP
  - ▶ CORELAP
  - ▶ Factory Flow
  - ▶ Proplanner

# Computer Software

- ▶ Proplanner analysis
  - ▶ Distance traveled reduced by 38%

Before

After

# Computer Software

- ▶ Three dimensional visualization software allows managers to view possible layouts and assess process, material handling, efficiency, and safety issues

# Work Cells

- ▶ Reorganizes people and machines into groups to focus on single products or product groups
- ▶ Group technology identifies products that have similar characteristics for particular cells
- ▶ Volume must justify cells
- ▶ Cells can be reconfigured as designs or volume changes

# Advantages of Work Cells

1. Reduced work-in-process inventory
2. Less floor space required
3. Reduced raw material and finished goods inventories
4. Reduced direct labor cost
5. Heightened sense of employee participation
6. Increased equipment and machinery utilization
7. Reduced investment in machinery and equipment

# Requirements of Work Cells

- ▶ Identification of families of products
- ▶ A high level of training, flexibility and empowerment of employees
- ▶ Being self-contained, with its own equipment and resources
- ▶ Test (poka-yoke) at each station in the cell

# Improving Layouts Using Work Cells

Figure 9.9 (a)

Current layout - workers in small closed areas.

Improved layout - cross-trained workers can assist each other. May be able to add a third worker as additional output is needed.

# Improving Layouts Using Work Cells

Figure 9.9 (b)

Current layout - straight lines make it hard to balance tasks because work may not be divided evenly

Improved layout - in U shape, workers have better access. Four cross-trained workers were reduced.

U-shaped line may reduce employee movement and space requirements while enhancing communication, reducing the number of workers, and facilitating inspection

# Staffing and Balancing Work Cells

## Determine the takt time

$$\text{Takt time} = \frac{\text{Total work time available}}{\text{Units required}}$$

## Determine the number of operators required

$$\text{Workers required} = \frac{\text{Total operation time required}}{\text{Takt time}}$$

# Staffing Work Cells Example

600 Mirrors per day required

Mirror production scheduled for 8 hours per day

From a work balance  
chart total operation  
time = 140 seconds

Figure 9.10

# Staffing Work Cells Example

600 Mirrors per day required

Mirror production scheduled for 8 hours per day

From a work balance

chart total operation

time = 140 seconds

$$\begin{aligned}\text{Takt time} &= (8 \text{ hrs} \times 60 \text{ mins}) / 600 \text{ units} \\ &= .8 \text{ min} = 48 \text{ seconds}\end{aligned}$$

$$\begin{aligned}\text{Workers required} &= \frac{\text{Total operation time required}}{\text{Takt time}} \\ &= 140 / 48 = 2.92\end{aligned}$$

# Work Balance Charts

- ▶ Used for evaluating operation times in work cells
- ▶ Can help identify bottleneck operations
- ▶ Flexible, cross-trained employees can help address labor bottlenecks
- ▶ Machine bottlenecks may require other approaches

# Focused Work Center and Focused Factory

- ▶ Focused Work Center
  - ▶ Identify a large family of similar products that have a large and stable demand
  - ▶ Moves production from a general-purpose, process-oriented facility to a large work cell
- ▶ Focused Factory
  - ▶ A focused work cell in a separate facility
  - ▶ May be focused by product line, layout, quality, new product introduction, flexibility, or other requirements

# Repetitive and Product-Oriented Layout

**Organized around products or families of similar high-volume, low-variety products**

1. Volume is adequate for high equipment utilization
2. Product demand is stable enough to justify high investment in specialized equipment
3. Product is standardized or approaching a phase of life cycle that justifies investment
4. Supplies of raw materials and components are adequate and of uniform quality

# Product-Oriented Layouts

- ▶ Fabrication line
  - ▶ Builds components on a series of machines
  - ▶ Machine-paced
  - ▶ Require mechanical or engineering changes to balance
- ▶ Assembly line
  - ▶ Puts fabricated parts together at workstations
  - ▶ Paced by work tasks
  - ▶ Balanced by moving tasks

Both types of lines must be balanced so that the time to perform the work at each station is the same

# Product-Oriented Layouts

## Advantages

1. Low variable cost per unit
2. Low material handling costs
3. Reduced work-in-process inventories
4. Easier training and supervision
5. Rapid throughput

## Disadvantages

1. High volume is required
2. Work stoppage at any point ties up the whole operation
3. Lack of flexibility in product or production rates

# McDonald's Assembly Line

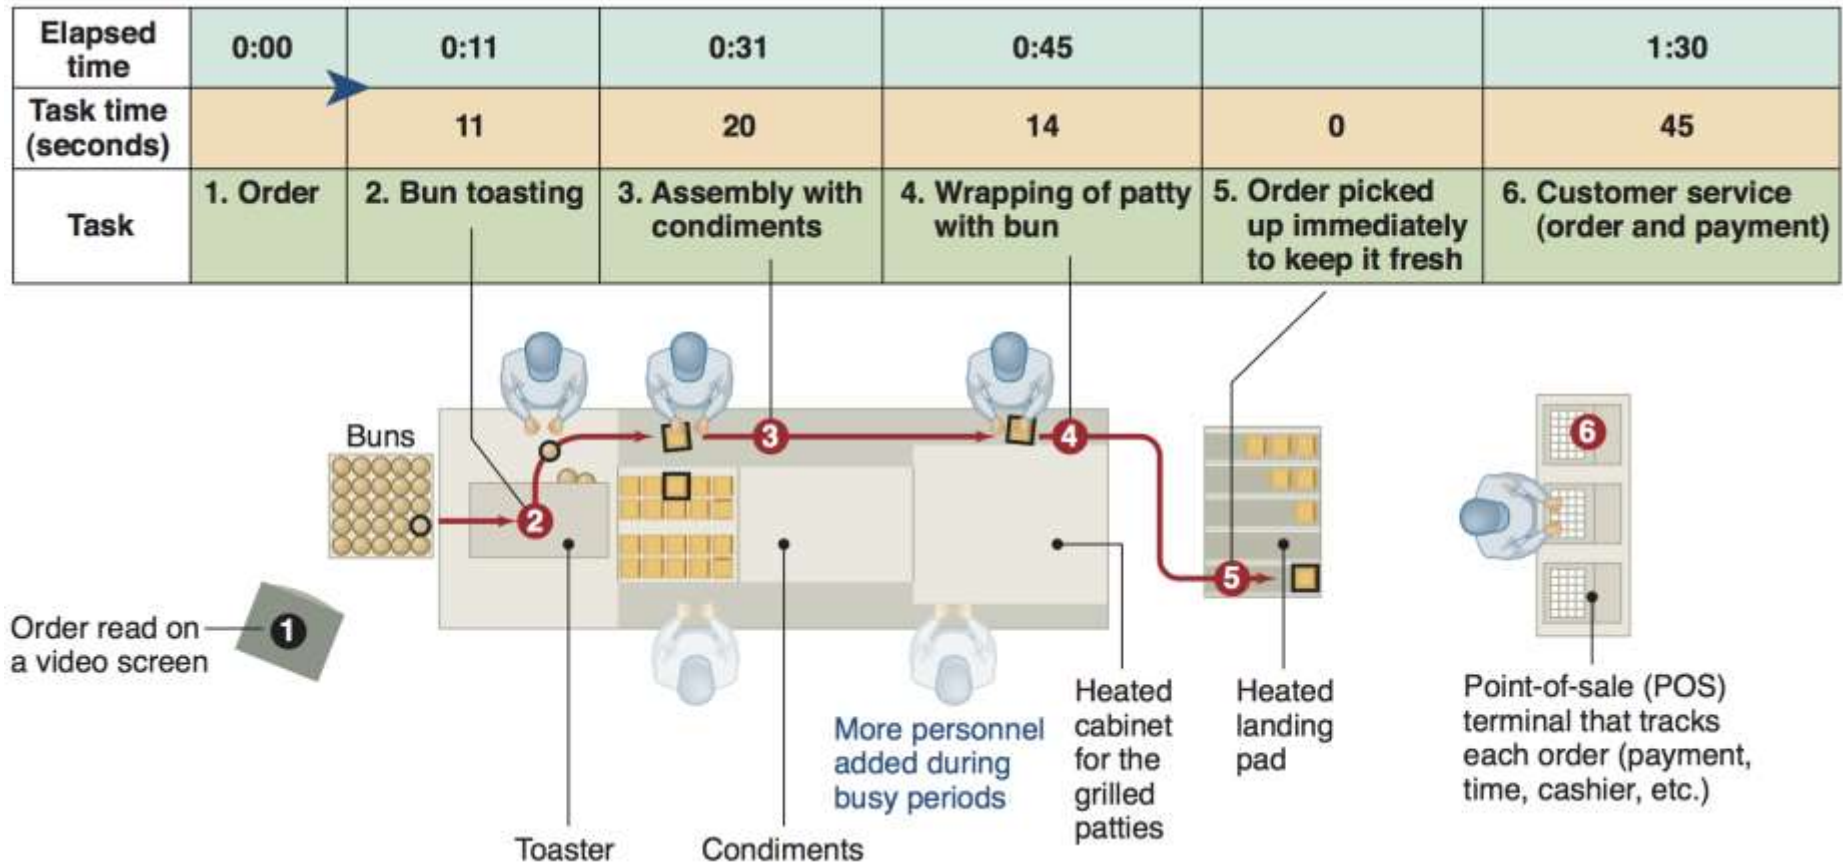

Figure 9.11

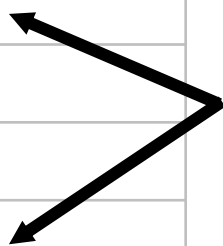

# Assembly-Line Balancing

- ▶ Objective is to minimize the imbalance between machines or personnel while meeting required output
- ▶ Starts with the precedence relationships
  - ▶ Determine cycle time
  - ▶ Calculate theoretical minimum number of workstations
  - ▶ Balance the line by assigning specific tasks to workstations

# Wing Component Example

**TABLE 9.2** Precedence Data for Wing Component

TASK	ASSEMBLY TIME (MINUTES)	TASK MUST FOLLOW TASK LISTED BELOW	
A	10	—	<p>This means that tasks B and E cannot be done until task A has been completed</p> 
B	11	A	
C	5	B	
D	4	B	
E	11	A	
F	3	C, D	
G	7	F	
H	11	E	
I	3	G, H	
Total time		65	

# Wing Component Example

TABLE 9.2      Precedence Data for Wing Component		
TASK	ASSEMBLY TIME (MINUTES)	TASK MUST FOLLOW TASK LISTED BELOW
A	10	
B	11	
C	5	
D	4	
E	11	
F	3	
G	7	
H	11	
I	3	
Total time		65

480 available mins per day  
40 units required

$$\begin{aligned} \text{Cycle time} &= \frac{\text{Production time available per day}}{\text{Units required per day}} \\ &= 480 / 40 \\ &= 12 \text{ minutes per unit} \end{aligned}$$

$$\begin{aligned} \text{Minimum number of workstations} &= \frac{\sum_{i=1}^n \text{Time for task } i}{\text{Cycle time}} \\ &= 65 / 12 \\ &= 5.42, \text{ or } 6 \text{ stations} \end{aligned}$$

9.12

# Wing Component Example

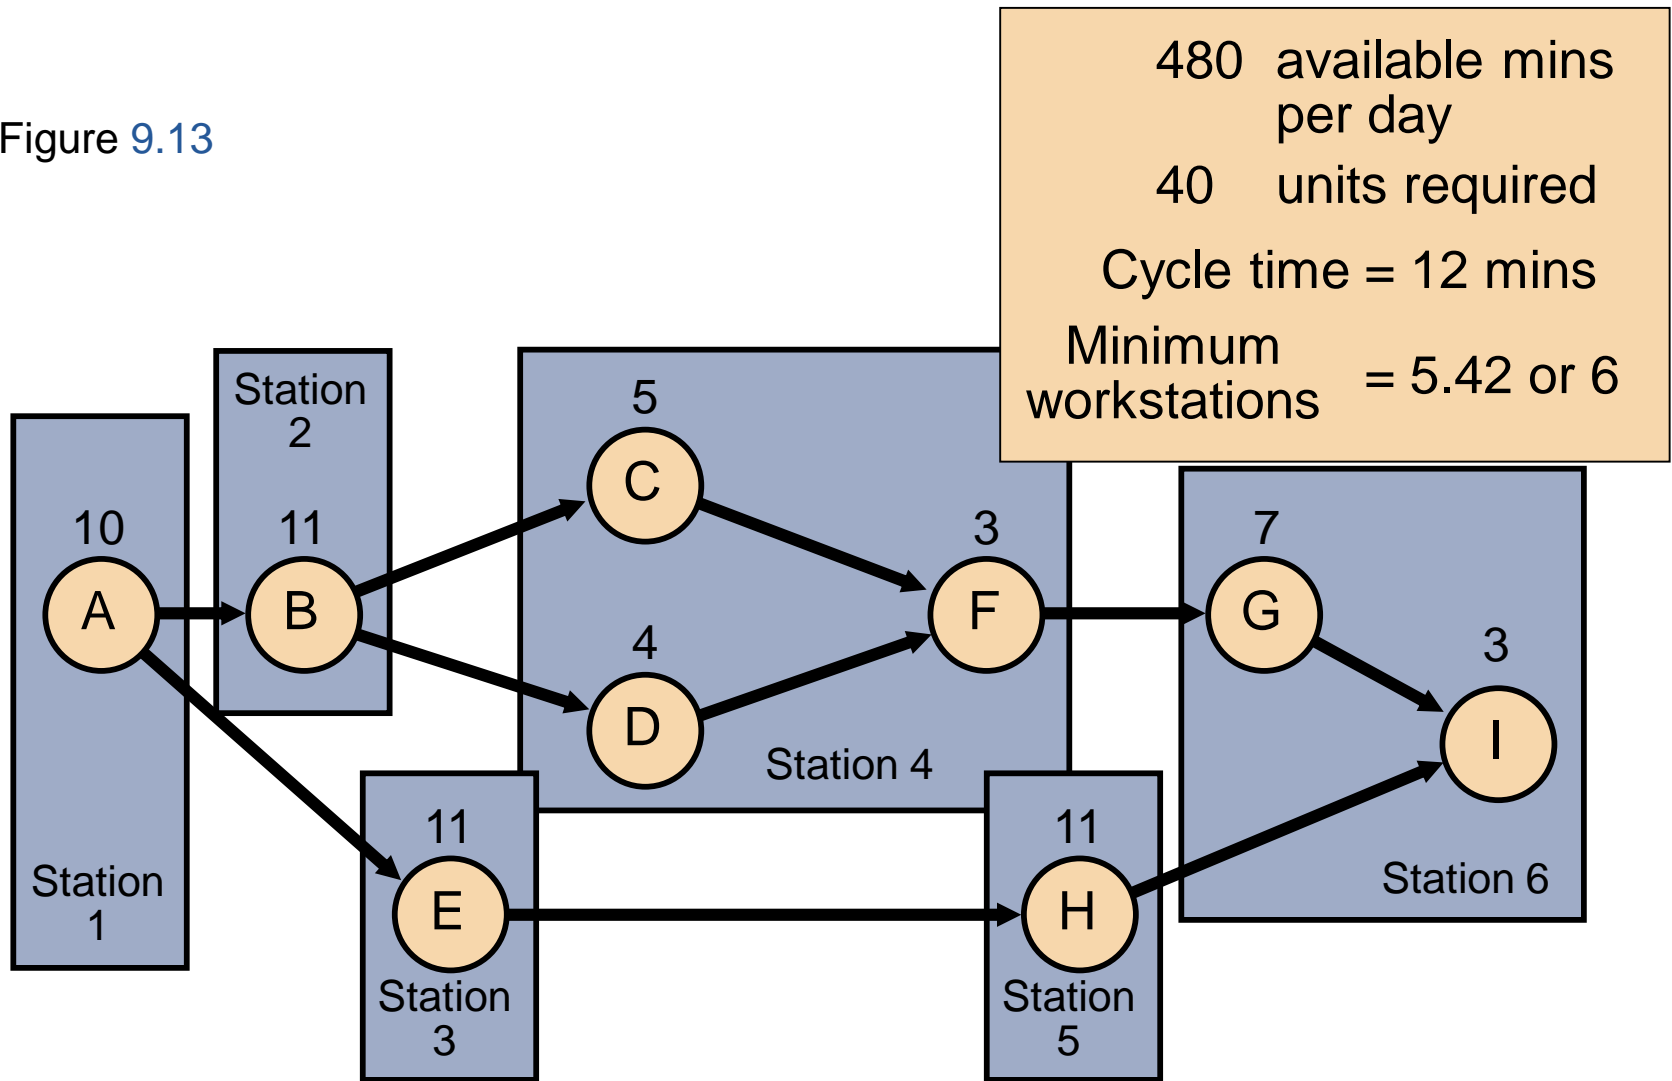

**TABLE 9.3**

Layout Heuristics That May Be Used to Assign Tasks to Workstations in Assembly-Line Balancing

1. Longest task time	From the available tasks, choose the task with the largest (longest) task time
2. Most following tasks	From the available tasks, choose the task with the largest number of following tasks
3. Ranked positional weight	From the available tasks, choose the task for which the sum of following task times is the longest
4. Shortest task time	From the available tasks, choose the task with the shortest task time
5. Least number of following tasks	From the available tasks, choose the task with the least number of subsequent tasks

# Wing Component Example

Figure 9.13

# Wing Component Example

TABLE 9.2      Precedence Data for Wing Component		
TASK	ASSEMBLY TIME (MINUTES)	TASK MUST FOLLOW TASK LISTED BELOW
A	10	—
B	11	A
C	5	B
D	4	B

480 available mins per day

40 units required

Cycle time = 12 mins

Minimum workstations = 5.42 or 6

Figure 9.12

$$\begin{aligned}
 \text{Efficiency} &= \frac{\sum \text{Task times}}{(\text{Actual number of workstations}) \times (\text{Largest cycle time})} \\
 &= 65 \text{ minutes} / ((6 \text{ stations}) \times (12 \text{ minutes})) \\
 &= 90.3\%
 \end{aligned}$$
